Al Boot Camp

Exploring Data through Visualizations

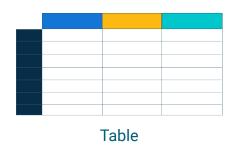

Module 7 Day 1

- 1 Explain why it is important to explore data before using it for machine learning.
- 2 Create line plots, bar charts, and scatter plots by using Matplotlib.
- 3 Customize the appearance of Matplotlib charts.

Introduction to Data Exploration with Visualizations

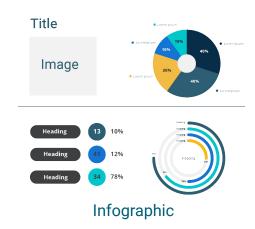

Examples of Data Visualizations

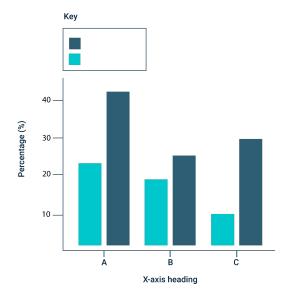

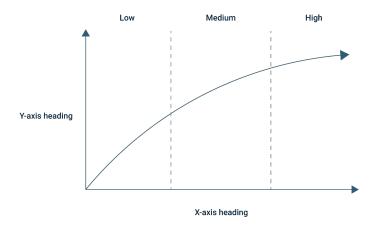

Since communication is the primary purpose of data visualizations, it's important that they be easy to read, easy to interpret, and aesthetically pleasing.

Explanatory visualizations are data visualizations that are primarily intended for communication. They are intended to explain your findings to people who may not be familiar with it.

Exploratory visualizations are data visualizations that are created to explore patterns. These are generated at the beginning of a project in the early stages of data analysis, or even before any has happened.

This week, we'll focus on exploratory visualizations.

Identify patterns in data by using visualizations.

Questions?

M M M M

Introduction to Pyplot and Line Plots

Create a line plot using Pyplot.

Suggested Time:

Break15 mins

Configuring Line Plots

Use keyword arguments to customize Pyplot visualizations.

Suggested Time:

Bar Charts

Construct and customize a bar chart representing the density of commuting cars per 1,000 population aged 16 and over in major US cities

Suggested Time:

Scatter Plots

Create a scatter plot.

Suggested Time:

Let's recap

- 1 Explain why it is important to explore data before using it for machine learning.
- 2 Create line plots, bar charts, and scatter plots by using Matplotlib.
- 3 Customize the appearance of Matplotlib charts.

Next

In the next lesson, we will move onto using the Pandas library and DataFrames to generate visualizations.
